Skewness Analysis of Variables

Symmetrical Majority:

- The majority of the variables, including 'season' and 'temp', exhibit skewness values close to zero, suggesting relatively symmetrical distributions.

Positive Skewness Insights:

- Variables such as 'holiday', 'weather', 'windspeed', 'casual', 'registered', and 'count' demonstrate positive skewness, pointing to a concentration of lower values and a rightward skew in their distributions.

Negative Skewness Observations:

- In contrast, 'workingday', 'atemp', and 'humidity' exhibit negative skewness, implying a concentration of higher values and a leftward skew in their distributions.

Overview and Feature Patterns

Temporal and Numerical Composition:

- **The dataset encompasses both datetime information and various numerical features associated with bike rentals. The observations span from January 1, 2011, to December 19, 2012.**

Diverse Numerical Feature Characteristics:

- **Numerical features such as temperature, humidity, windspeed, and counts of casual and registered bike rentals show diverse ranges and distributions, highlighting the variability in rental patterns across different conditions.**

Temporal Patterns and Concentrations:

- **Observations on the year, day, and hour variables indicate temporal patterns, with a concentration in 2011 and 2012, a mean day value around 10, and an hourly distribution ranging from 0 to 23.**

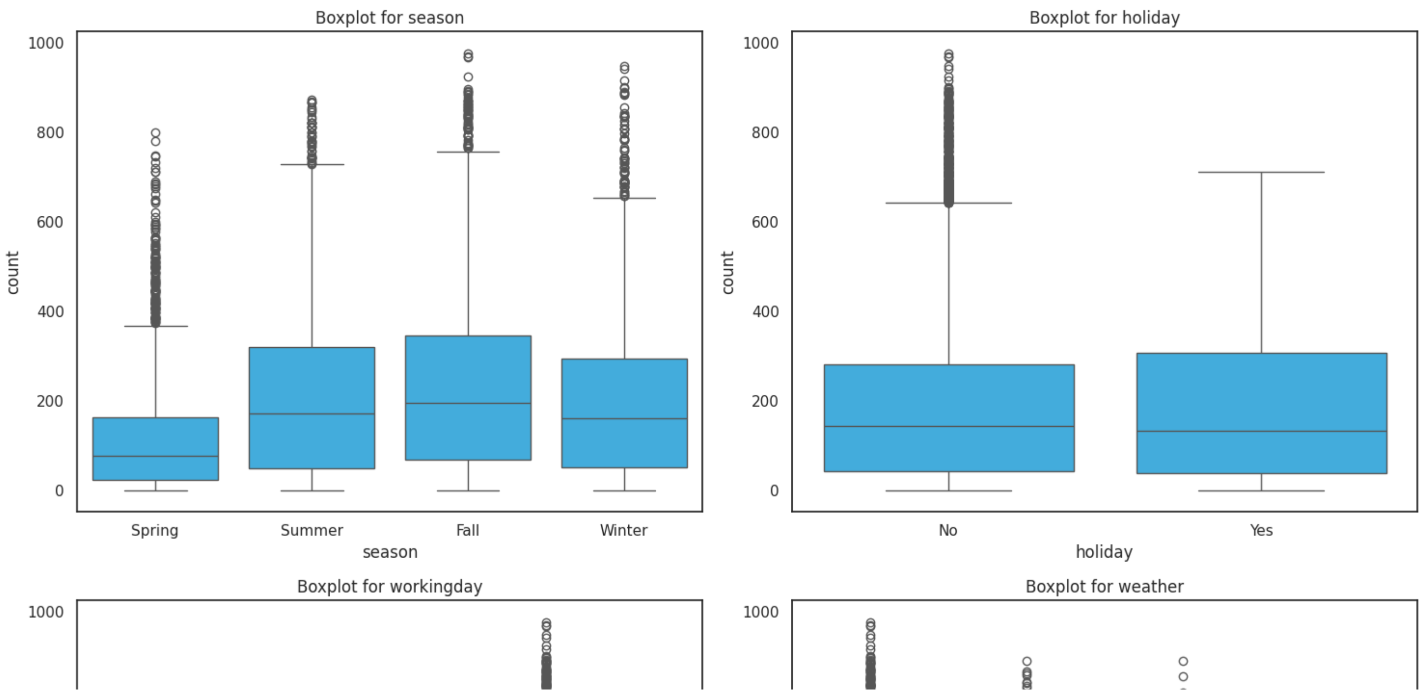
Outlier Detection

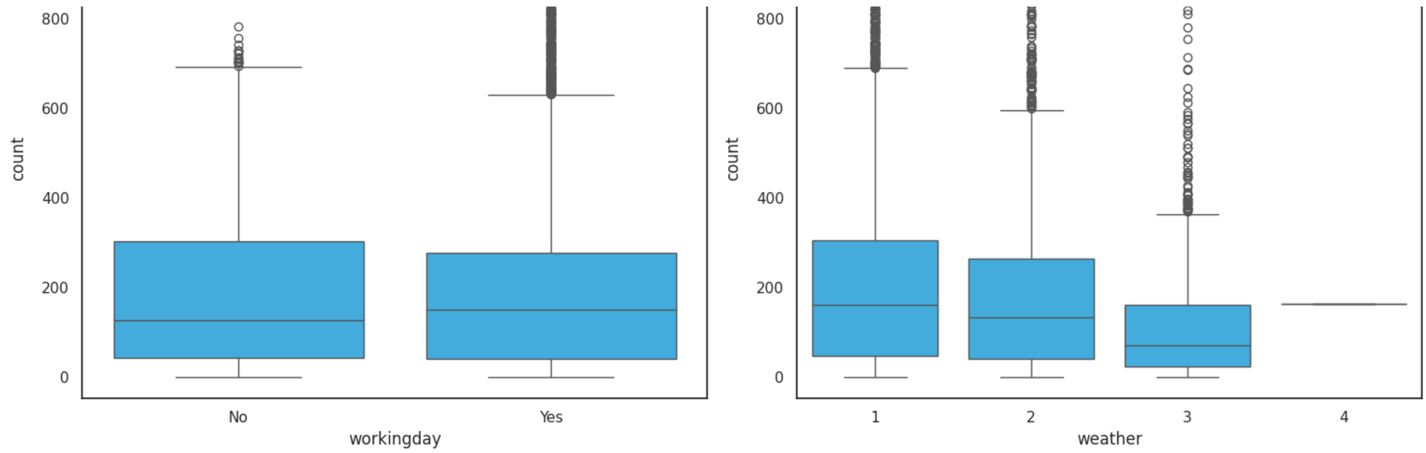
In [335]:

```
plt.figure(figsize=(15, 12))
sns.set(style="white")

for i, column in enumerate(cat_col,1):
    plt.subplot(2, 2, i)
    sns.boxplot(x=column, y='count', data=df, color="#29B6F6")
    plt.title(f'Boxplot for {column}')

plt.tight_layout()
plt.show()
```





Outlier Analysis

Outliers in Different Seasons:

- **In spring and winter, there are more unusual values in the data compared to other seasons.**

Weather Outliers:

- **Category 3 weather has a lot of unusual values, while category 4 weather doesn't have any.**

Working Days vs. Holidays:

- **On regular working days, there are more unusual values in the data than on holidays. This suggests some unexpected patterns during typical workdays that might need a closer look.**

Numerical column analysis

Temp:

- **The 'temp' column shows a diverse temperature range (0.82 to 41.0), with a median of 20.5 and moderate variability around the mean of approximately 20.23 degrees Celsius.**

Atemp

- **The 'atemp' column displays a wide range of apparent temperatures (0.76 to 45.455), with a mean of approximately 23.66 and moderate variability around the median of 24.24.**

Humidity

- **The 'humidity' column depicts a range of humidity values (0 to 100), with an average around 61.89. The distribution shows moderate variability, from 47 at the 25th percentile to 77 at the 75th percentile, indicating diverse humidity levels in the dataset.**

WindSpeed

- **The 'windspeed' column displays a range of wind speeds from 0 to 56.9979, with a mean of approximately 12.80.**

Casual

- **The 'casual' column demonstrates a broad range of casual bike rental counts, with values spanning from 0 to 367. The distribution is positively skewed, as indicated by the mean (36.02) being less than the median (17.0).**

Registered

- **The 'registered' column showcases a diverse range of registered bike rental counts, ranging from 0 to 886. The distribution is positively skewed, evidenced by the mean (155.55) being less than the median (118.0).**

Count

- **The 'count' column reveals a wide range of total bike rental counts, varying from 1 to 977. The distribution is positively skewed, with a mean (191.57) greater than the median (145.0), indicating a concentration of lower values**

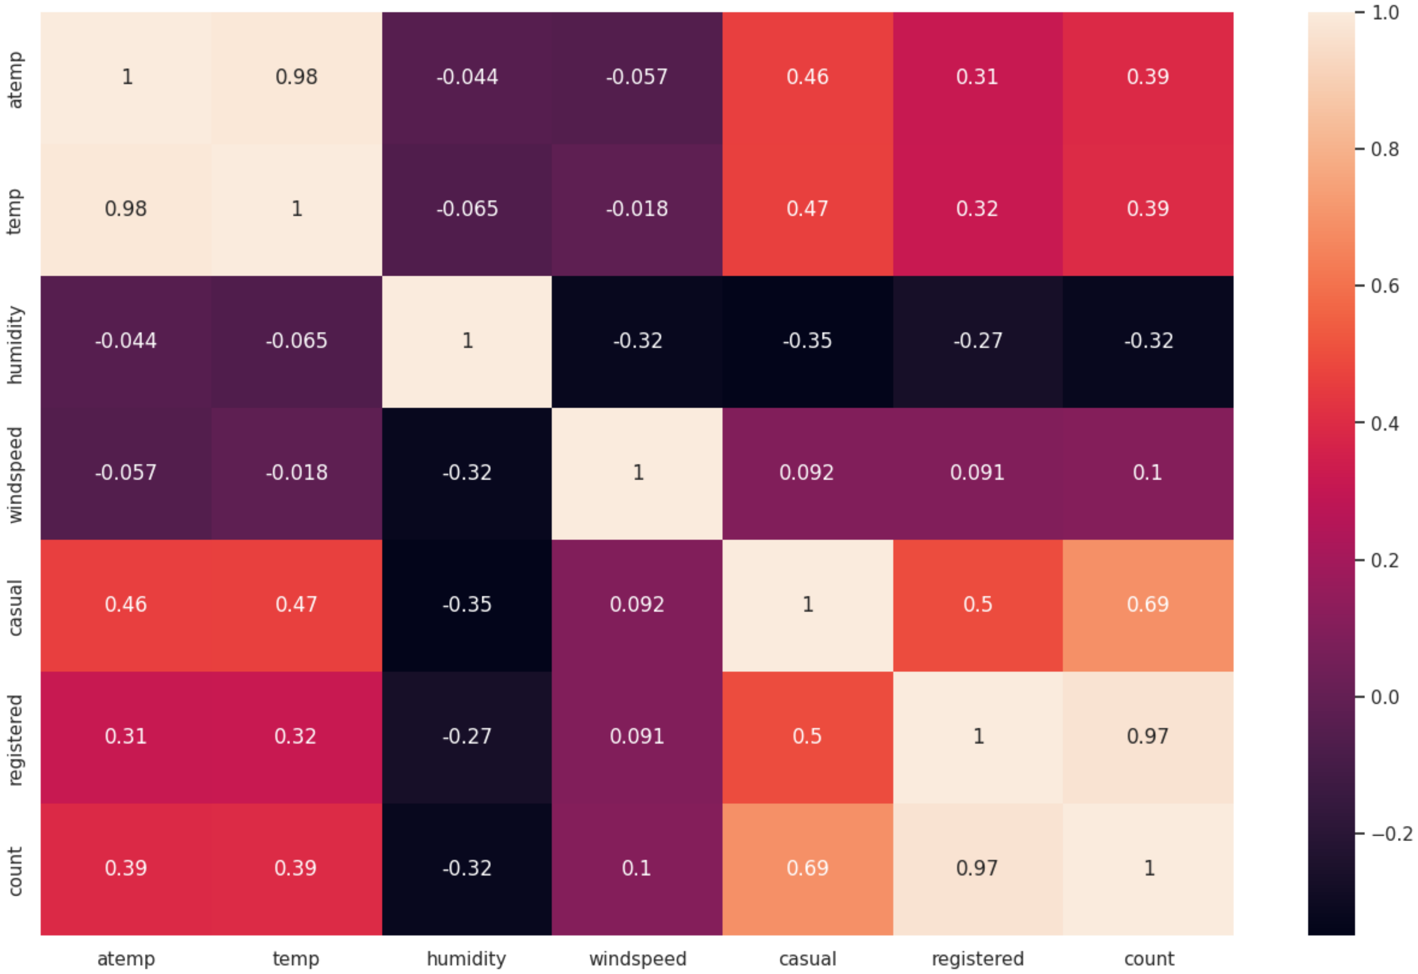
count	0.389784	0.394454	-0.317371	0.101369	0.690414	0.970948	1.000000

In [351]:

```
# correlation chart

plt.figure(figsize = (16, 10))
sns.heatmap(correlation_matrix, annot = True)
plt.show()
```



Correlation Analysis

Atemp:

- Strong positive correlation with 'temp' (0.98), indicating a close relationship.
- Moderate positive correlation with 'casual' (0.46) and 'registered' (0.31).
- Positive correlation with 'count' (0.39), suggesting a relationship with overall bike rentals.

Temp (Temperature):

- Highly correlated with 'atemp' (0.98), indicating a strong connection.
- Moderate positive correlation with 'casual' (0.47) and 'registered' (0.32).
- Positive correlation with 'count' (0.39), showing a relationship with overall bike rentals.

Humidity:

- Weak negative correlation with 'atemp' (-0.04) and 'temp' (-0.06).
- Moderate negative correlation with 'casual' (-0.35), 'registered' (-0.27), and 'count' (-0.32).
- Indicates a tendency for fewer bike rentals during higher humidity.

Windspeed:

- Weak negative correlation with 'atemp' (-0.06) and 'temp' (-0.02).
- Weak positive correlation with 'casual' (0.09), 'registered' (0.09), and 'count' (0.10).
- Suggests a subtle influence on bike rentals with increasing wind speed.

Casual (Casual Bike Rentals):

- **Strong positive correlation with 'atemp' (0.46) and 'temp' (0.47).**
- **Moderate negative correlation with 'humidity' (-0.35) and positive correlation with 'windspeed' (0.09).**
- **Highly correlated with 'registered' (0.50) and 'count' (0.69), indicating a significant impact on overall rentals.**

Registered (Registered Bike Rentals):

- **Positive correlation with 'atemp' (0.31) and 'temp' (0.32).**
- **Negative correlation with 'humidity' (-0.27) and positive correlation with 'windspeed' (0.09).**
- **Highly correlated with 'casual' (0.50) and 'count' (0.97), emphasizing a substantial impact on overall rentals.**

Count (Total Bike Rentals):

- **Positive correlation with 'atemp' (0.39), 'temp' (0.39), and 'casual' (0.69).**
- **Negative correlation with 'humidity' (-0.32).**
- **Highly correlated with 'registered' (0.97), emphasizing the joint impact of casual and registered rentals on the overall count.**

In [352]:

```
# counts based on months

monthly_count = df.groupby('month')['count'].sum().reset_index()

monthly_count = monthly_count.sort_values(by='count', ascending=False)

monthly_count
```

Out[352]:

	month	count
6	June	220733
5	July	214617
1	August	213516
11	September	212529
10	October	207434
8	May	200147
9	November	176440
0	April	167402
2	December	160160
7	March	133501
3	February	99113
4	January	79884

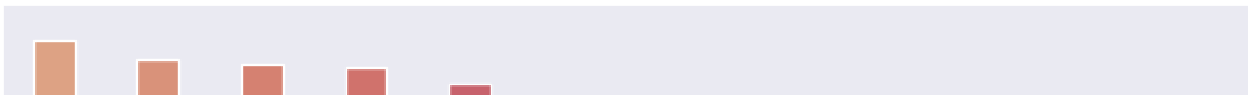
In [353]:

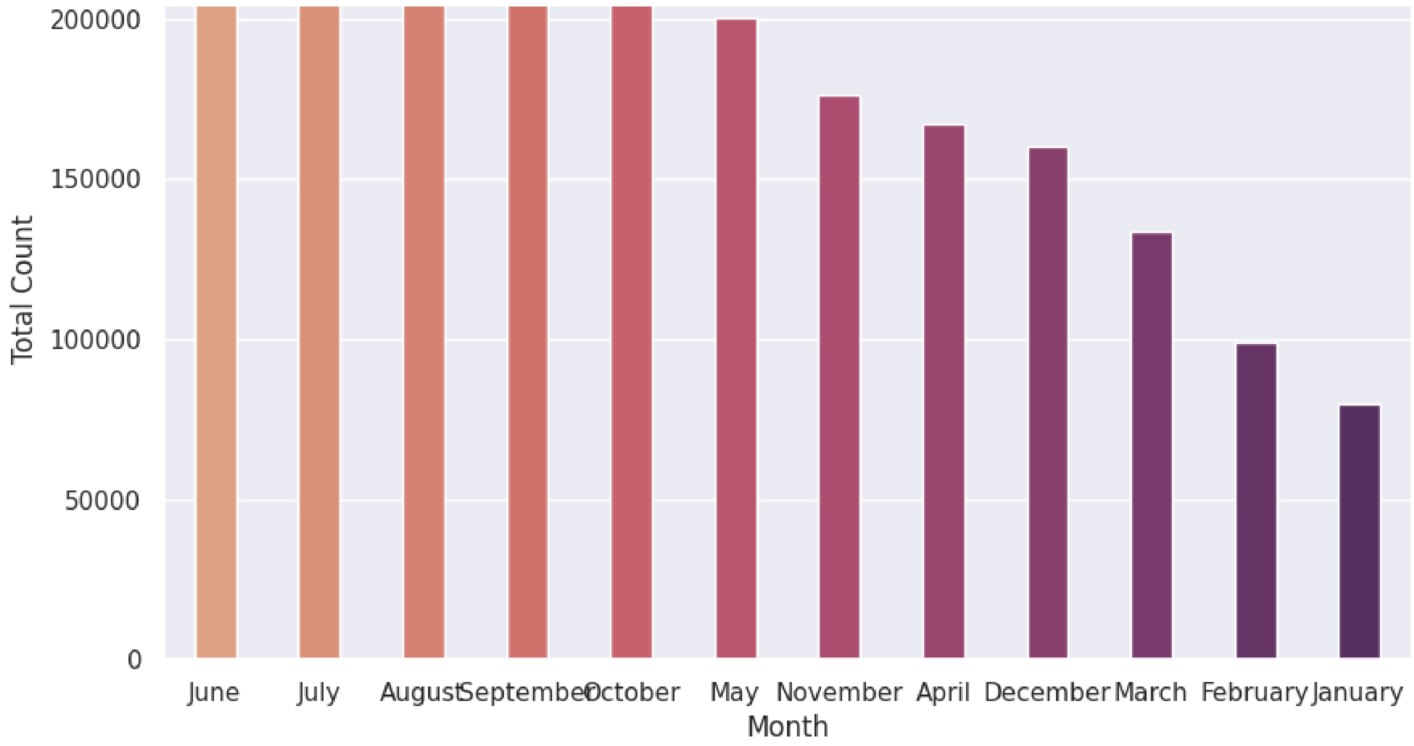
```
# rentals on monthly counts

plt.figure(figsize=(10, 6))
sns.barplot(x='month', y='count', data=monthly_count, palette='flare', width = 0.4)

plt.title('Total Count by Month')
plt.xlabel('Month')
plt.ylabel('Total Count')
plt.show()
```

Total Count by Month





Monthly analysis on rentals

Peak Rental Months:

- **June stands out as the peak month for bike rentals, with the highest count of 220,733, followed closely by July and August.**

Seasonal Trend:

- **Summer months (June, July, August) show higher bike rental counts, consistent with favorable weather conditions.**

Off-Peak Rental Months:

- **January, February, and March have notably lower bike rental counts, indicating potential off-peak periods, possibly influenced by colder weather or fewer outdoor activities.**

Hypothesis Testing

Demand of bicycles on rent is the same on Weekdays & Weekends

Since we have two independent saples, we can go with Two Sample Independent T-Test.

Assumptions of Two Sample Independent T-Test :

- **The data should be normall distributed**
- **variances of the two groups are equal**

Let the Confidence interval be 95%, so siginificance (alpha) is 0.05

To check if the data is normal, we will go with Wilkin-ShapiroTest.

The test hypothesis for the Wilkin-Shapiro test are:

- **Ho: Data is normally distributed**
- **Ha: Data is not normally distributed.**

In [354]:

```
np.random.seed(41)

df_subset = df.sample(100)["count"]

test_stat, p_val = shapiro(df_subset)

p_val
```

Out[354]:

```
np.float64(2.6341210395843134e-07)
```

Hence the p_values is lesser than the significance level, Null hypothesis can be rejected.

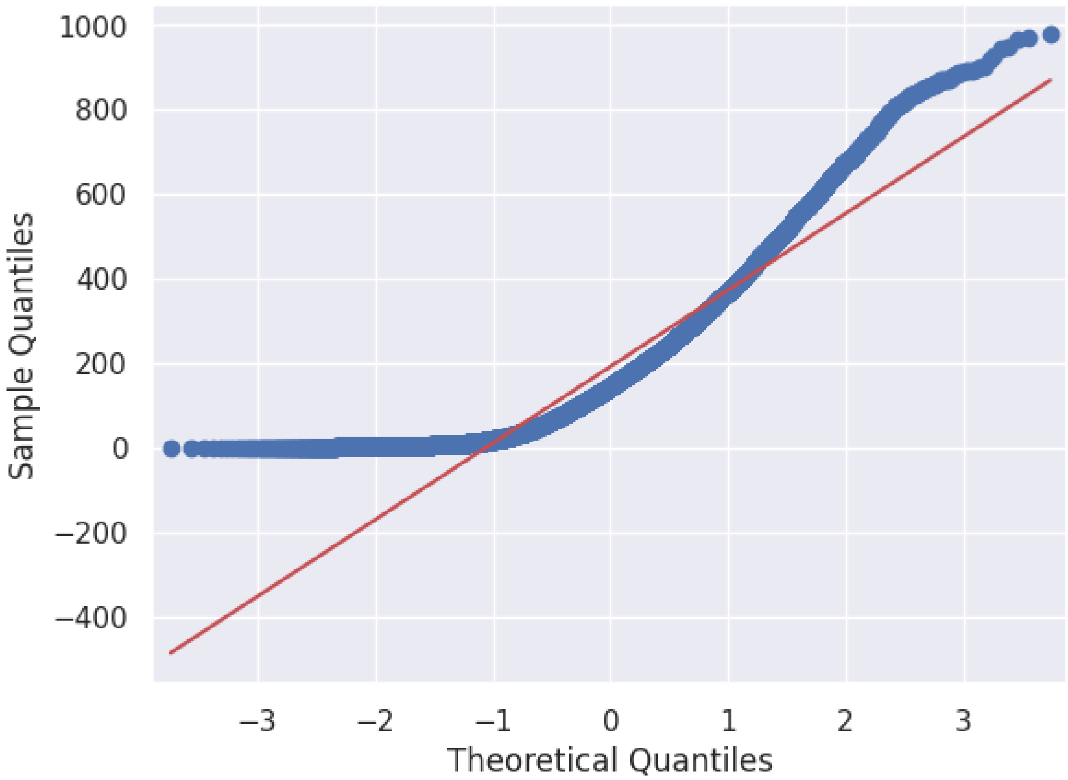
Therefore, the Data is not normally distributed.

QQ Plot analysis

In [355]:

```
# QQ plot

qqplot(df['count'], line = 's')
plt.show()
```



To check if the variances of two groups are equal. We will perform Levene's test

The Test hypotheses for Levene's test are:

- **Ho: The variances are equal.**
- **Ha: The variances are not equal.**

In [356]:

```
working_day = df[df['workingday'] == 'Yes']['count']
```

```
holiday = df[df['workingday'] == 'No']['count']

levene_stat, p_val = levene(working_day, holiday)

p_val
```

Out[356]:

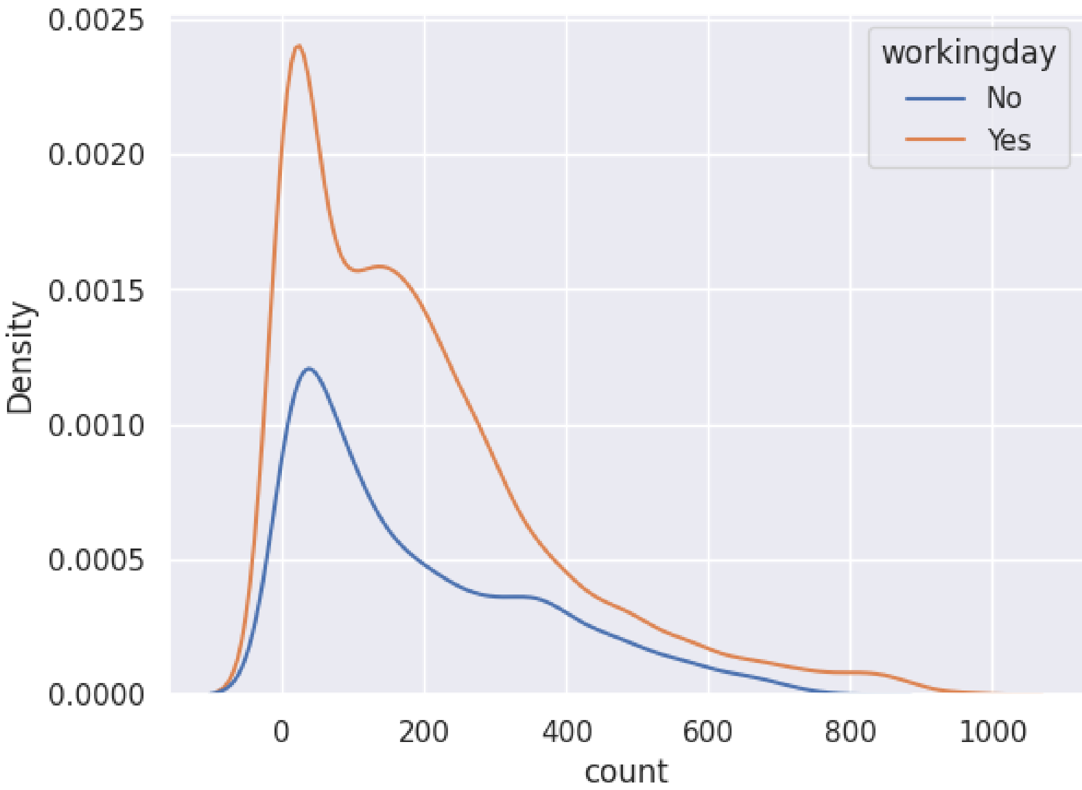
```
np.float64(0.9437823280916695)
```

In [357]:

```
sns.kdeplot(data = df, x = 'count', hue = 'workingday')
```

Out[357]:

```
<Axes: xlabel='count', ylabel='Density'>
```

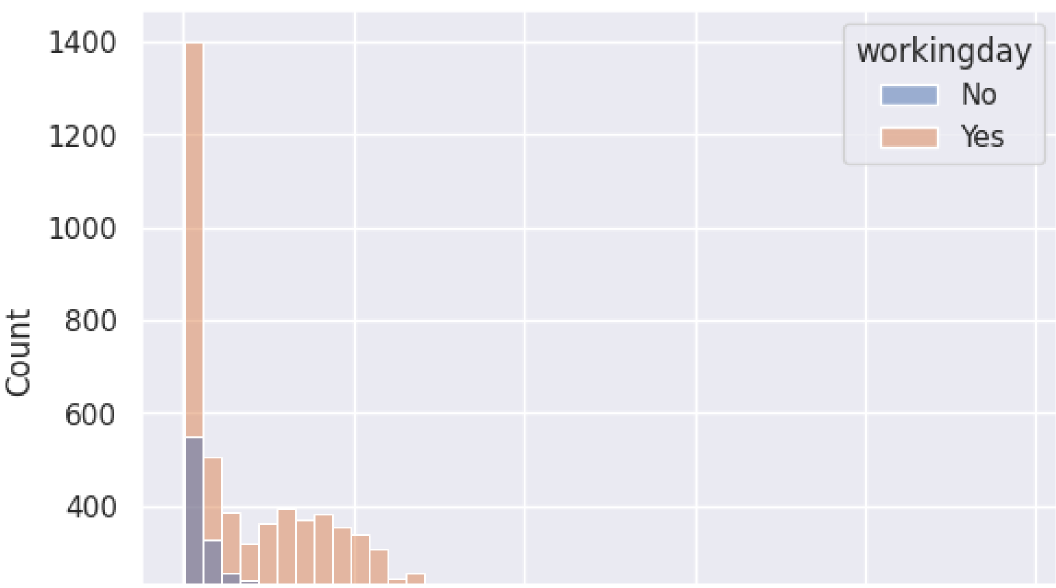


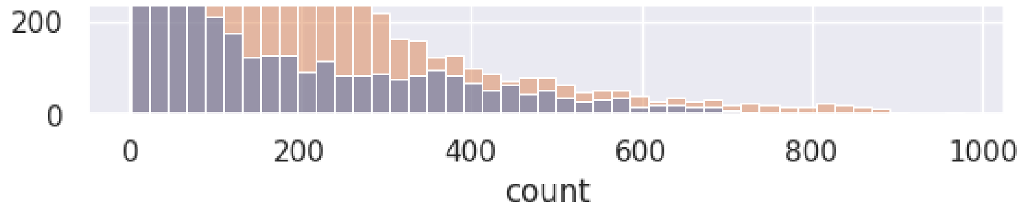
In [358]:

```
sns.histplot(data = df, x = 'count', hue = 'workingday')
```

Out[358]:

```
<Axes: xlabel='count', ylabel='Count'>
```





Hence the p_values is greater than the significance level, Null hypothesis can be accepted.

Therefore, the variances are approximately equal.

Despite the data is not normally distributed according to both the Wilkin-ShapiroTest and qq-plot

It is important to highlight that the variances between the two groups are equal

So we can proceed with the Two Sample Independent T-Test.**

The hypothesis for the t-test are:

- **Ho: There is no significant difference between working and non-working days.**
- **Ha: There is a significant difference between working and non-working days.**

In [359]:

```
ttest_stat, p_val = ttest_ind(working_day, holiday)

p_val
```

Out[359]:

```
np.float64(0.22644804226361348)
```

Hence the p_values is greater than the significance level, Null hypothesis can be accepted.

Therefore, There is no significant difference on bike rentals between working and non-working days.

In [360]:

```
kruskal_stat, p_val = kruskal(working_day, holiday)

p_val
```

Out[360]:

```
np.float64(0.9679113872727798)
```

Hence the p_values is greater than the significance level, Null hypothesis can be accepted.

Therefore, There is no significant difference on bike rentals between working and non-working days.

Demand of bicycles on rent is the same for different Weather conditions

Since we have more than two categories now, so will use ANOVA here.

Assumptions for ANOVA are:

1. **The population data should be normally distributed- The data is not normal as verified by Wilkin-Shapiro test and the qqplot.**
2. **The data points must be independent- This condition is satisfied.**
3. **Approximately equal variance within groups- This will be verified using Levene's test.**

In [361]:

```
# skewness of weather

df.groupby('weather')['count'].skew()
```

Out[361]:

	count
weather	
1	1.139857
2	1.294444
3	2.187137
4	NaN

dtype: float64

In [362]:

```
# kurtosis test of weather

df.groupby('weather')['count'].apply(lambda x: x.kurtosis())
```

Out[362]:

	count
weather	
1	0.964720
2	1.588430
3	6.003054
4	NaN

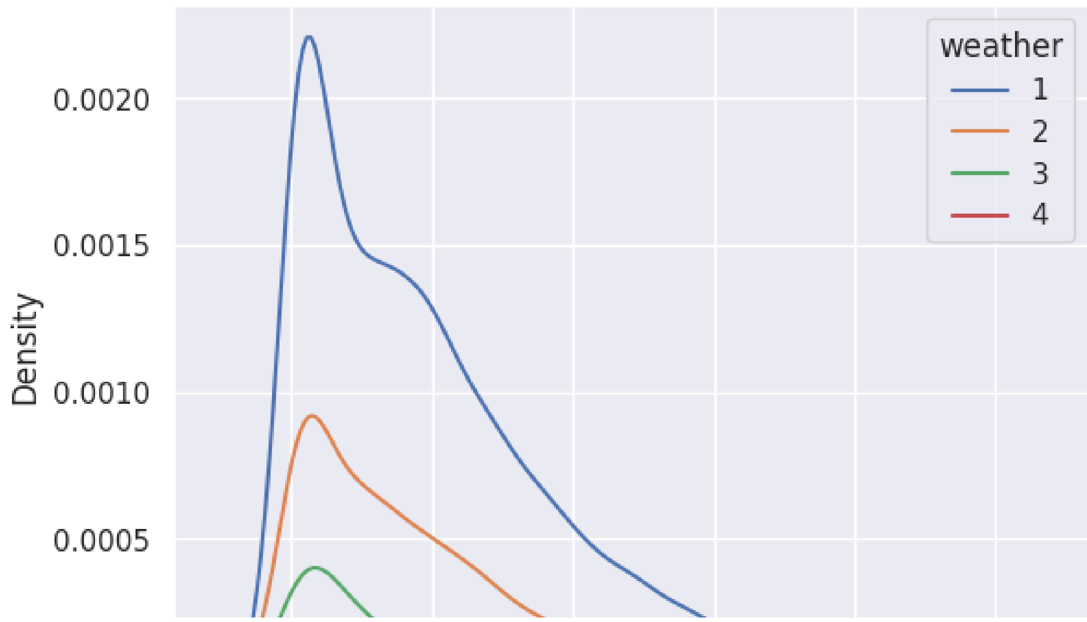
dtype: float64

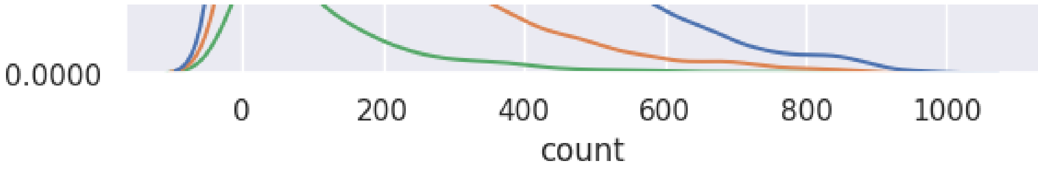
In [363]:

```
sns.kdeplot(data = df, x = 'count', hue = 'weather')
```

Out[363]:

<Axes: xlabel='count', ylabel='Density'>



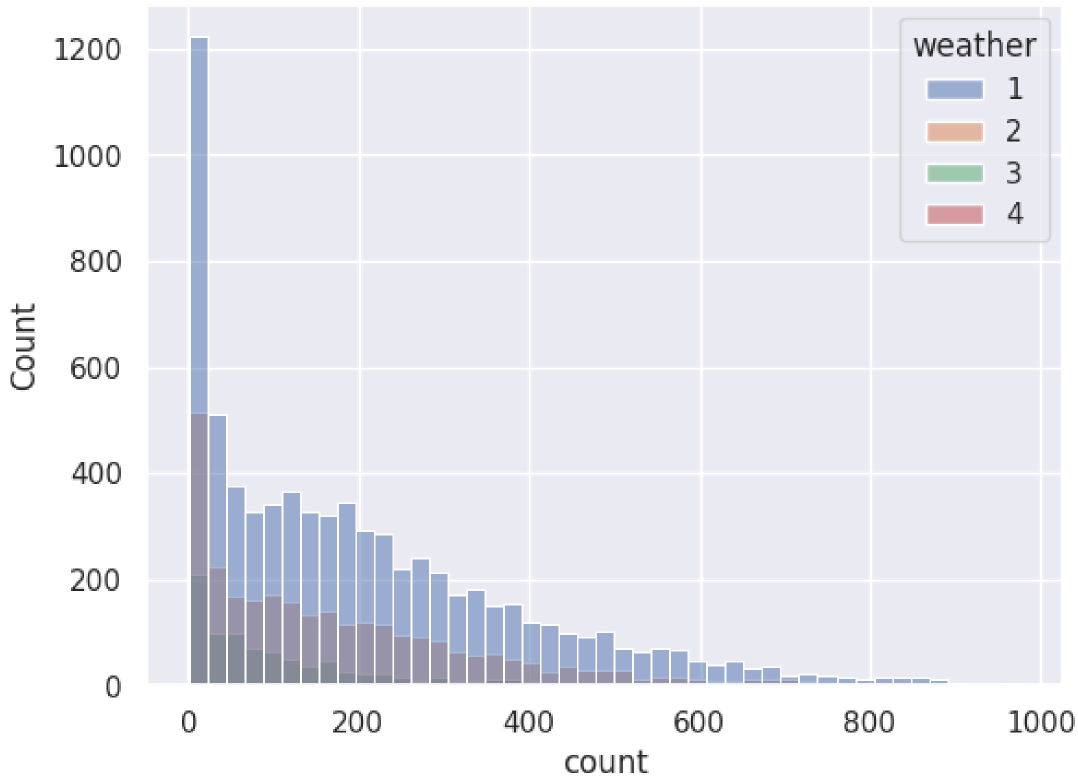


In [364]:

```
sns.histplot(data = df, x = 'count', hue = 'weather')
```

Out[364]:

```
<Axes: xlabel='count', ylabel='Count'>
```



The Test hypothesis for Levene's test are:

- **Ho: The variances are equal.**
- **Ha: The variances are not equal.**

In [365]:

```
weather1 = df[df['weather'] == 1]['count']
weather2 = df[df['weather'] == 2]['count']
weather3 = df[df['weather'] == 3]['count']
weather4 = df[df['weather'] == 4]['count']

levene_stat, p_val = levene(weather1, weather2, weather3,weather4)

p_val
```

Out[365]:

```
np.float64(3.504937946833238e-35)
```

Hence the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, the variances are not equal.

Two of the three conditions of ANOVA are not met, We will still perform ANOVA .

Then We will also perform Kruskal's test and compare the results .

In case of any discrepancies, Kruskal's test results will be considered, since data does not met conditions of ANOVA.

The hypothesis for ANOVA are:

- **Ho: There is no significant difference between demand of bicycles for different Weather conditions.**
- **Ha: There is a significant difference between demand of bicycles for different Weather conditions.**

In [366]:

```
anova_stat, p_val = f_oneway(weather1, weather2, weather3,weather4)

p_val
```

Out[366]:

```
np.float64(5.482069475935669e-42)
```

Hence the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, There is a significant difference between demand of bicycles for different Weather conditions.

Kruskal Test on weather

In [367]:

```
kruskal_stat, p_val = kruskal(weather1, weather2, weather3,weather4)

p_val
```

Out[367]:

```
np.float64(3.501611300708679e-44)
```

Again the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, we can conclude that there is a significant difference between demand of bicycles for different Weather conditions.

Demand of bicycles on rent is the same for different Seasons

Here also we have more than two categories now, so will use ANOVA here.

Assumptions for ANOVA are:

1. The population data should be normally distributed- The data is not normal as verified by **Wilkin-Shapiro test and the qqplot.**
2. The data points must be independent- This condition is satisfied.
3. Approximately equal variance within groups- This will be verified using **Levene's test.**

In [368]:

```
# skewness of seasons

df.groupby('season')['count'].skew()
```

Out[368]:

count

season	count
Spring	1.888056
Summer	1.003264
Fall	0.991495
Winter	1.172117

dtype: float64

In [369]:

```
# kurtosis test of seasons

df.groupby('weather')['count'].apply(lambda x: x.kurtosis())
```

Out[369]:

weather	count
1	0.964720
2	1.588430
3	6.003054
4	NaN

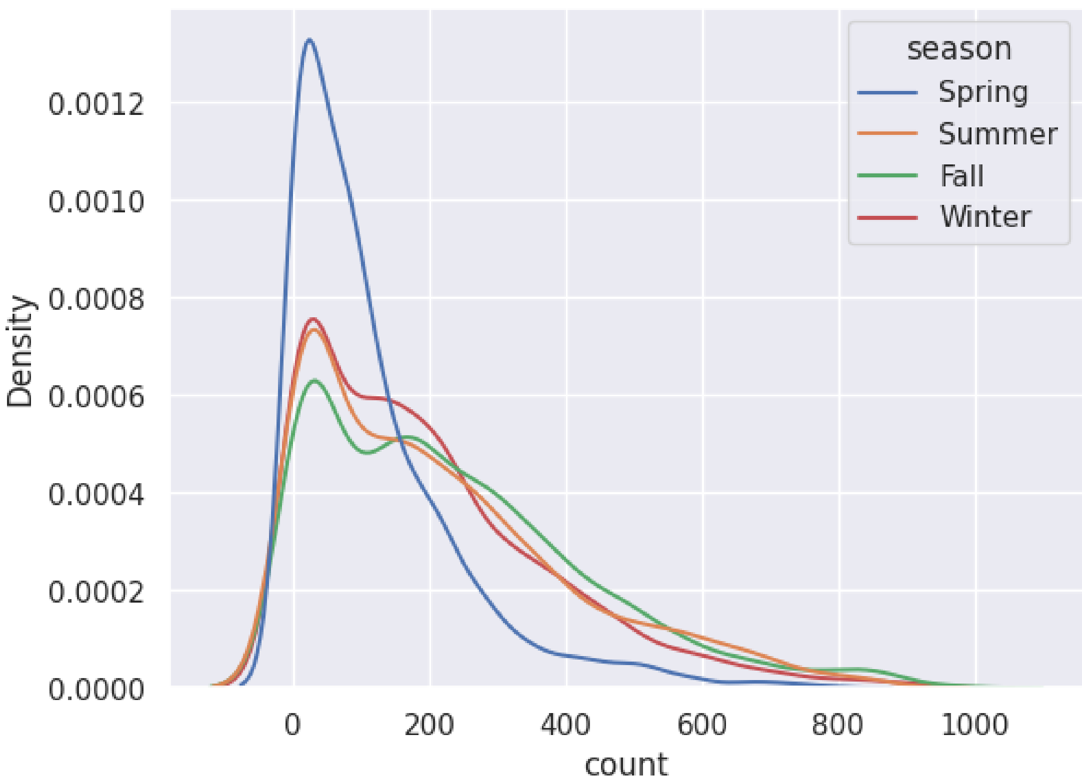
dtype: float64

In [370]:

```
sns.kdeplot(data = df, x = 'count', hue = 'season')
```

Out[370]:

<Axes: xlabel='count', ylabel='Density'>



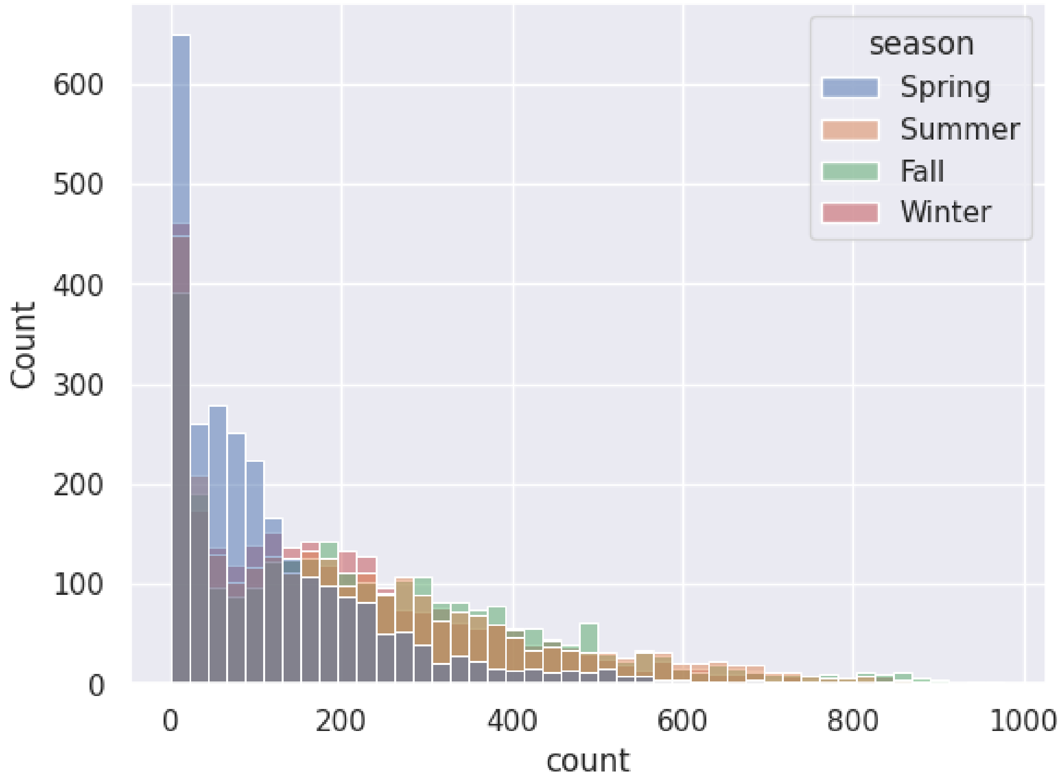
In [371]:

```
sns.histplot(data = df, x = 'count', hue = 'season')
```

Out[371]:

Out[371]:

<Axes: xlabel='count', ylabel='Count'>



The Test hypothesis for Levene's test are:

- **Ho: The variances are equal.**
- **Ha: The variances are not equal.**

In [372]:

```
spring = df[df['season'] == 'Spring']['count']
summer = df[df['season'] == 'Summer']['count']
fall = df[df['season'] == 'Fall']['count']
winter = df[df['season'] == 'Winter']['count']

levene_stat, p_val = levene(spring,summer,fall,winter)

p_val
```

Out[372]:

```
np.float64(1.0147116860043298e-118)
```

Hence the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, the variances are not equal.

As like before, we still use both ANOVA and Kruskal's test, comparing the results.

If discrepancies arise, we'll rely on Kruskal's test, Since data does not met the conditions for ANOVA.

The hypothesis for ANOVA are:

- **Ho: There is no significant difference between demand of bicycles for different Seasons.**
- **Ha: There is a significant difference between demand of bicycles for different Seasons.**

In [373]:

```
anova_stat, p_val = f_oneway(spring ,summer, fall, winter)

p_val
```

Out[373]:

```
np.float64(6.164843386499654e-149)
```

Hence the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, There is a significant difference between demand of bicycles for different Seasons.

Kruskal Test on season

In [374]:

```
kruskal_stat, p_val = kruskal(spring ,summer, fall, winter)

p_val
```

Out[374]:

```
np.float64(2.479008372608633e-151)
```

Again the p_values is smaller than the significance level, Null hypothesis can be rejected.

Therefore, we can conclude that there is a significant difference between demand of bicycles for different Seasons.

Analysis of Weather Conditions Across Seasons using Chi-square Test

The hypothesis for the chi-square test are:

Ho: Season and Weather are independent of each other.

Ha: Season and Weather are dependent on each other.

In [375]:

```
contingency_table = pd.crosstab(df['weather'], df['season'])

contingency_table
```

Out[375]:

season	Spring	Summer	Fall	Winter
weather				
1	1759	1801	1930	1702
2	715	708	604	807
3	211	224	199	225
4	1	0	0	0

In [376]:

```
chi2_contingency(contingency_table)
```

Out[376]:

```
Chi2ContingencyResult(statistic=np.float64(49.15865559689363), pvalue=np.float64(1.549925
0736864862e-07), dof=9, expected_freq=array([[1.77454639e+03, 1.80559765e+03, 1.80559765e
+03, 1.80625831e+03],
       [6.99258130e+02, 7.11493845e+02, 7.11493845e+02, 7.11754180e+02],
       [2.11948742e+02, 2.15657450e+02, 2.15657450e+02, 2.15736359e+02],
       [2.46738931e-01, 2.51056403e-01, 2.51056403e-01, 2.51148264e-01]]))
```

Hence the p_values(1.5499250736864862e-07) is smaller than the significance level, Null hypothesis can be rejected.

Therefore, we can conclude that Season and Weather are dependent on each other.

Strategic Recommendations for Yulu's Profitable Growth

Optimize Bike Deployment During Peak Seasons

Focus distribution efforts on high-demand months—particularly **June, July, and August**—to take advantage of increased ridership due to favorable weather and seasonal behavior.

Seasonal Marketing Campaigns

Roll out marketing campaigns aligned with summer peaks to attract more users. Emphasize themes like **ease of commuting**, **eco-friendliness**, and **exclusive seasonal promotions.**

Boost Engagement in Off-Peak Months

Encourage ridership during slower periods (e.g., **January to March**) through **targeted discounts**, **loyalty incentives**, and **bundled ride packages** to ensure year-round revenue stability.

Implement Weather-Based Dynamic Pricing

Introduce **flexible pricing** that reacts to weather changes—offering discounts during **rainy or cold spells**, and premium pricing on **sunny, high-demand days** to maximize earnings.

Diversify Revenue Streams

Explore non-ride revenue channels such as **brand partnerships**, **in-app advertising**, **event collaborations**, and **tiered membership plans** with exclusive benefits.

Enhance the User Experience

Improve technology infrastructure and service quality by streamlining the **app interface**, ensuring **prompt bike maintenance**, and strengthening **customer support** to retain users.

Optimize Weekday Deployment Strategy

With consistent usage across weekdays and weekends, adopt a **balanced deployment model** to ensure optimal fleet distribution and **operational efficiency** throughout the week.

Tailor Promotions to Weather Conditions

Use real-time weather data to trigger **context-specific promotions.** For instance, launch **limited-time offers** during rainy days or cooler periods to keep users engaged.

Seasonally Adaptive Advertising

Develop advertising themes tailored to each season—promote **freedom and fun in summer**, **comfort and convenience in monsoon or winter**—to better connect with user mindsets.

Integrate Seasonal and Weather Planning

Align **fleet availability** with both **seasonal demand** and **short-term weather forecasts** to ensure the right number of bikes are in the right places at the right time.

In [376]:
